

Manual

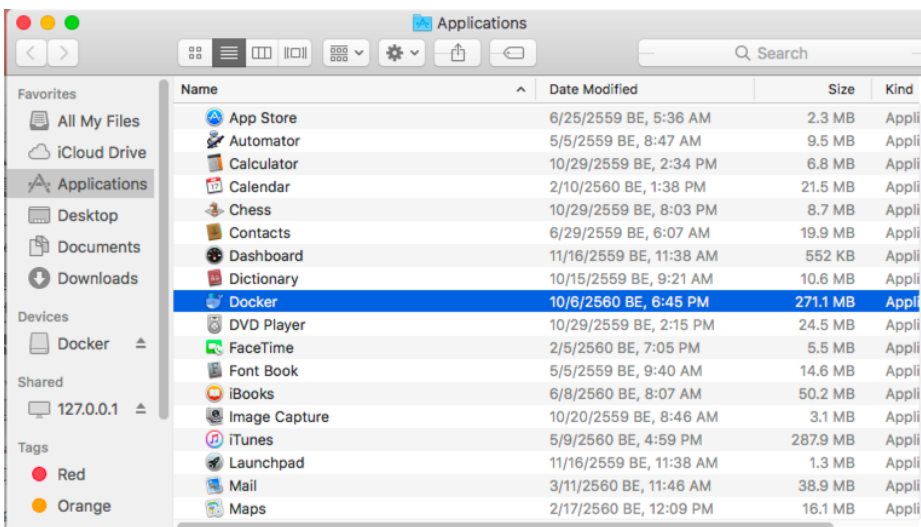

Install Docker for Mac OSX

Install Docker for Mac OS

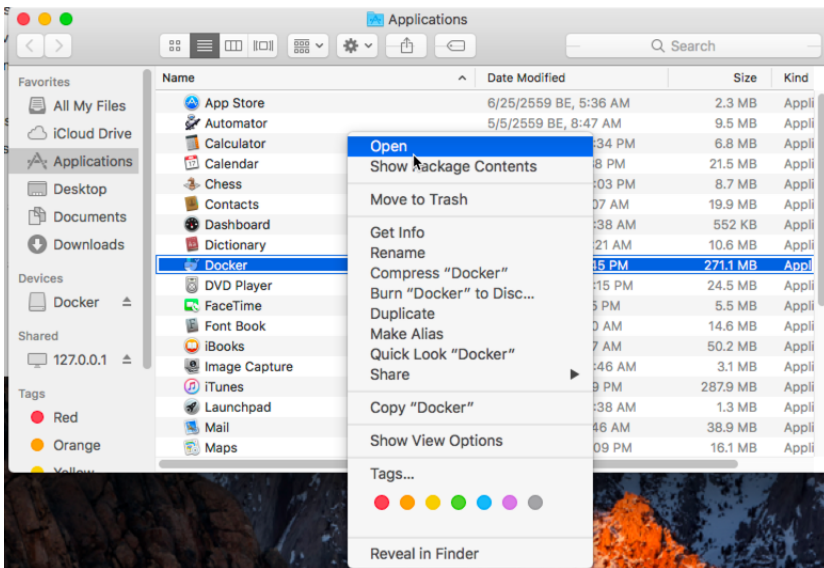

1. Double click "Docker.dmg" from path "software" for start installation

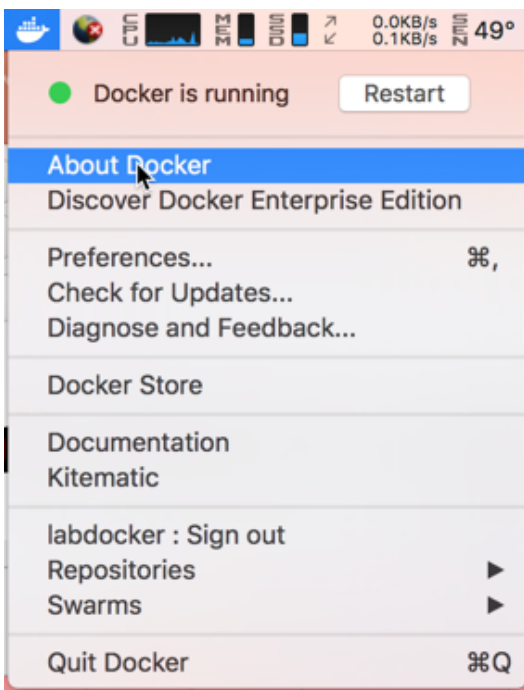

2. Drag docker.app to Applications

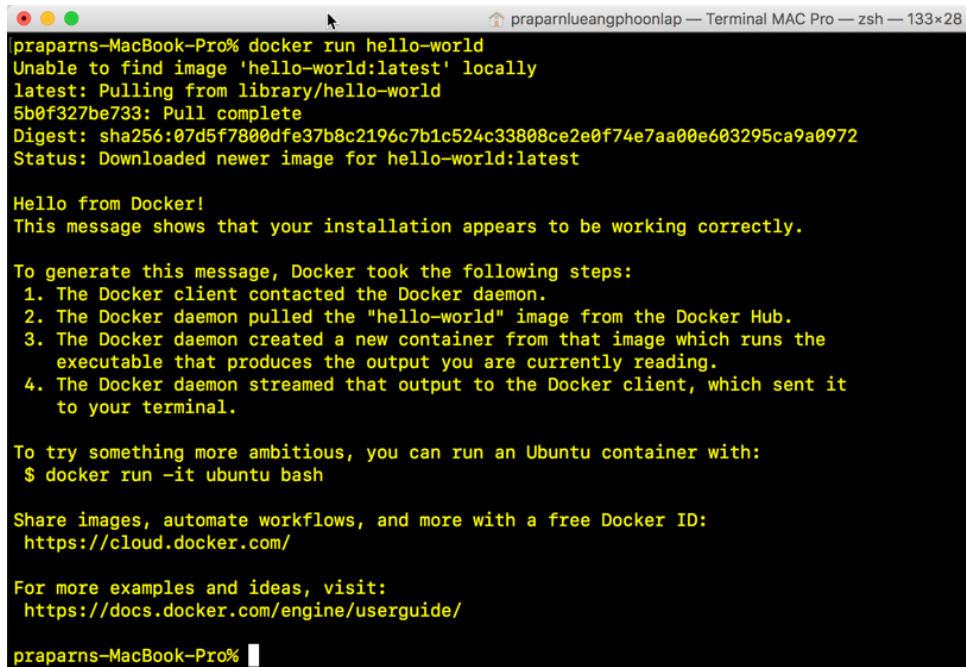

3. Start docker by click "Docker" and "Open"

4. Docker icon will shown on top menu. Please wait until docker status show running

5. Test run first container by command: `docker run hello-world` on terminal

The image shows a terminal window titled 'praparnlueangphoonlap — Terminal MAC Pro — zsh — 133x28'. The terminal output for the command `docker run hello-world` is as follows:

```
praparns-MacBook-Pro% docker run hello-world
Unable to find image 'hello-world:latest' locally
latest: Pulling from library/hello-world
5b0f327be733: Pull complete
Digest: sha256:07d5f780dfe37b8c2196c7b1c524c33808ce2e0f74e7aa00e603295ca9a0972
Status: Downloaded newer image for hello-world:latest

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:
1. The Docker client contacted the Docker daemon.
2. The Docker daemon pulled the "hello-world" image from the Docker Hub.
3. The Docker daemon created a new container from that image which runs the
   executable that produces the output you are currently reading.
4. The Docker daemon streamed that output to the Docker client, which sent it
   to your terminal.

To try something more ambitious, you can run an Ubuntu container with:
$ docker run -it ubuntu bash

Share images, automate workflows, and more with a free Docker ID:
